

To whom it may concern:

The **Neutral Posture® orthopedic chair**, from Neutral Posture, Inc. employs the neutral posture concept (110°-128° trunk-thigh posture) which allows for the proper spacing on the anterior and posterior sides of the spine, causing no forward or rearward disc involvement, therefore eliminating the stress and fatigue experienced by a seated worker. This spinal alignment reduces the disc pressures in the spinal column; provides for greater relaxation of muscle, tendon and ligament systems during long periods of sitting; and provides overall improved circulation. The air lumbar adjustment in the contoured backrest allows for the precise amount of back support necessary for good lordosis. The arms of the chair adjust for width and height, while the arm pads themselves provide a 360° swivel adjustment. This allows for maximum arm support in various key-boarding or other repetitive-motion task intensive work. This unique adjustment feature allows the patient to support the weight of the arm on the armrest of the chair, thereby relieving strain in the neck and shoulder area.

As an **FDA registered medical device #1644461**, the Neutral Posture® chair ([any Neutral Posture® chair model will qualify](#)) provides the back support and posture adjustability necessary to work longer hours, as well as reduce the necessity for therapy and other medical treatments.

It is medically necessary for

Patient Name

Diagnosis: _____

to have FDA registered medical device #1644461, Model # _____ Neutral Posture® chair for use in their daily work. This chair will be necessary for the continued control and reduction of back pain for the rest of this patient's life.
